  - Contact

# Hardware

Resources

•00000000

# Compute Hardware

- 1 Altix node, 32 cores
- 586 Opteron nodes, over 1760 cores
- 400+ nodes on CAEN Grid
- Gigabit networking and Infiniband networking
- Upto 96GB of memory (64GB public) for SMP work

# Nyx

Resources

00000000

- nyx is the Opteron cluster;
- Login: nyx-login.engin.umich.edu

Mechanics: Usage

- Currently has 7TB NFS file system
- Running RedHat Enterprise Linux 4
- Uses PBS for Resource Access

Bighouse: Available to Aero Space Dept

# Hardware: bighouse

# Bighouse

Resources

000000000

- bighouse is our Itanium SMP machine;
- Login: bighouse.engin.umich.edu

Mechanics: Usage

- Shares nyx's 7TB NFS file system
- Running SuSE Linux Enterprise Server 10
- ProPack 5 from SGI
- Uses PBS for Resource Access
- Only available for benchmarking (Private)

The Scheduler

# Hardware: Grid

Resources

000000000

nodes are great for paramater sweaps, hundereds of jobs etconly for engin accounts

# **CAEN Grid**

- 400+ Nodes, Dual Core
- All nodes have 2GB Ram
- FAST Single cpus
- Some Parallel Ability
- Short Jobs Only
- Uses PBS for Resource Access

Mechanics: Usage

The Scheduler

Summary

# Software

# Nyx Defaults

- OpenMPI
- PGI Compilers

# Bighouse Defaults

- Message Passing Toolkit (MPT)
- Intel Compilers

# Grid Defaults

- OpenMPI
- PGI Compilers
- Intel Compilers

Common Software

Resources

00000•000

1. Show Example

The Scheduler

Scheduler

# Manipulating Software

Mechanics: Usage

All CAC systems use modules to control software. Users *can* and *should* write their own modules if needed.

# module commands

- module list Show loaded modules
- module load *modulename* Load *modulename* for use
- module avail modulename
   Show available versions of module modulename
- module rm modulename
   Remove currently loaded module

# Module Fun

Resources

00000000

# 1. example using fftw follows

# Module Customization

- ~/privatemodules/default
   Allows users to change their default modules.
- ~/privatemodules/module/version Holds user created module
- man modulefile

v List Loaded Modules

module list

# Module Example

- List Loaded Modules module list
- Show All Modules module avail
- Show All Versions of openmpi module avail openmpi
- Load FFTWmodule load fftw
- Show Variables defined by FFTW module show fftw

# Module Example

Resources

00000000

- List Loaded Modules module list
- Show All Modules module avail
- Show All Versions of openmpi module avail openmpi
- Load FFTW

  module load fftw
- Show Variables defined by FFTW module show fftw

# Module Example

Resources

00000000

# Introduction to the PBS Batch System

# **PBS**

- All access to the compute nodes (everything other than the login node) is via the batch system
- We use a system called Torque, it is derived from PBS
- The batch system controls access to queues
- The scheduling (Maui/Moab) system decides if and where jobs can run
- There is a single public queue: cac
- There are many private queues for people who own or rent
- If you don't know use the route queue

login node) is via the batch system

The batch system controls access to queues
 The scheduling (Maui/Moab) system decides if and where

 There are many private queues for people who own or rent nodes
 If you don't know use the route queue

# Introduction to the PBS Batch System

1. We can do priorities and limits in private queues as needed for those queues. Limits on User, group, hardware in use, time of use walltime are all options

Resources Mechanics: Usage

The Scheduler

Summary

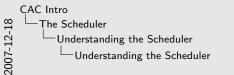

### Understanding the Scheduler

The scheduler determines what jobs can run, when they can run, and where. There are many factors that go into the scheduler's decision.

#### Limits and Priority

- Limited number jobs eligible for scheduling
- Maximum number of cpus in use by one person: depends on queue
- Maximum number of jobs in the queue at one time: no limit
- How long you've waited: the longer you wait, the higher your priority
- Your recent usage (fairshare): People with less usage over the past month will have a higher priority than those with a lot of usage

1. We can do priorities and limits in private queues as needed for those queues. Limits on User, group, hardware in use, time of use walltime are all options

Resources Mechanics: Usage

The Scheduler

Summa

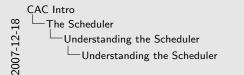

### Understanding the Scheduler

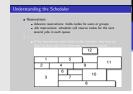

The scheduler determines what jobs can run, when they can run, and where. There are many factors that go into the scheduler's decision.

#### Limits and Priority

- Maximum number of jobs in the queue at one time: no limit
- How long you've waited: the longer you wait, the higher your priority
- Your recent usage (fairshare): People with less usage over the past month will have a higher priority than those with a lot of usage

# Understanding the Scheduler

Mechanics: Usage

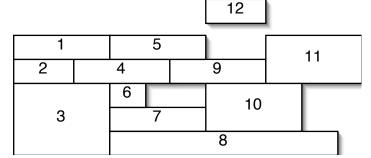

- Reservations
  - Advance reservations: holds nodes for users or groups
  - Job reservations: scheduler will reserve nodes for the next several jobs in each queue

The Scheduler

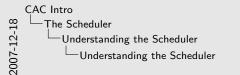

Backfill

Resources

 If the reservations leave holes in the schedule, they may be filled by short jobs that otherwise would have waited.

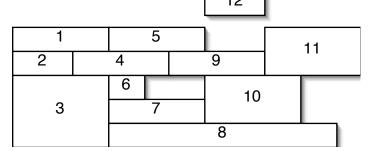

Resources Mechanics: Usage

0•0

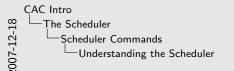

The Scheduler ○●○

# Understanding the Scheduler

- Reservations
  - Advance reservations: holds nodes for users or groups
  - Job reservations: scheduler will reserve nodes for the next several jobs in each queue
- Backfill
  - If the reservations leave holes in the schedule, they may be filled by short jobs that otherwise would have waited.

derstanding the Scheduler

There are several commands that can give you insight into the school-uler's decisions

- showq shows the state of the queue at that moment in time, showing the running jobs in order of soonest to finish to longest to finish; the side jobs in order of priority; and the blocked jobs in the order they were submitted
- diagnose -p shows the factors that go into computing
  the priority for all of the idle jobs
  should be depended for idle into this will show why the
- v checkjob jobnumber for idle jobs this will show why th job can't start
  v showstart jobnumber — this makes a (poor) estimate of
- when the job will start

- showstart *jobnumber* this makes a (poor) estimate of when the job will start

## Summary

Resources

#### Summary

- Resources
  - Lots of cpus
  - A reasonable amount of software
  - Watch or subscribe to http://cac.engin.umich.edu for updates
- Access
  - All access is via the SSH family of commands: ssh, sftp, scp
  - There are lots of clients for these commands for the different platforms
  - There is no graphical access, everything is via the command line

# Summary

Resources

### Summary Cont'd

- Job Submission
  - Every job needs a PBS script file
  - Two most important commands: qsub and qstat -au uniqname
- Job Scheduling
  - Scheduling depends on a lot of factors, it is best to submit jobs and let the scheduler optimize for their start.

### Summary
